

ACKNOWLEDGEMENTS

This study was accomplished with the willing and competent help of many persons. Graduate research assistants took responsibility for most of the field work and laboratory analyses and for much of the data analysis. Henry Boswell and Robert Hedes were especially important in initiating the project, and Michael Cross and Gregory Eiband in conducting the major data-gathering phase of the last two years. In addition, several students contributed for shorter periods, especially Suzanne Thompson, Dana Woodruff, and Kenneth Draper. Alice Carberry, Marilyn Maerker, Shichin Tzeng and Dr. Donald Francisco contributed much valuable advice and support in the laboratory.

Staff of the N.C. Division of Environmental Management, especially Jay Sauber, Jim Fisher, and David Goodrich, provided a wealth of information about wastewater treatment plants, swamp streams, and their interactions in eastern North Carolina. I also must express my appreciation for guidance provided by wetland scientists who participated in a workshop in spring 1988, including Robert Knight, Mark Brinson, John Day, Jared Bales, Larry Burns, Kevin Moorhead, Curtis Richardson, Jay Sauber, and the late William Odum. The help of all these persons is gratefully acknowledged.
